

STICKY STATIC

The Question is:

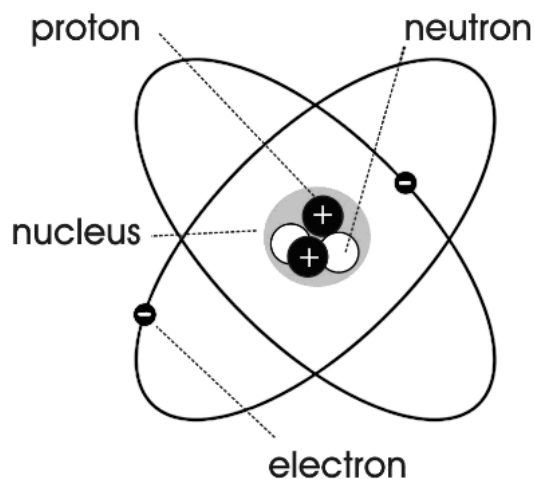

My Hypothesis is:

Is this an observation or an experiment?

Does an electron have **negative** or **positive** charge?

Are electrons **stuck in place** or can they **move around**?

The Atom!

What I observed about the rice Krispies was:

Key Words:

Atom: An atom is the basic building block of all physical things.

Electron: A part of an atom with a negative charge that is really small, and sometimes jumps around from atom to atom.

Proton: A part of an atom with a positive charge that can't move around.

Static: When positives and negatives are attracted to each other in different objects.
